

The user runs the Sudoku solver program to find one or more solutions for a given sudoku file.
The program reads the puzzle use the recursive algorithm to solve it
Actor user e
Precondition:
Check the valid puzzle file exists
And check the column and the row are correct and the file already have the error like which have two same number in a row or colum or the 3*3 grid

Postcondition:
The solutions are displayed if the puzzle is solvable
Or it will output the error message of the sudoku doesn't have the solution

The user provide a sudoku puzzle
The program precheck of the sudoku
The program solving the sudoku
If a solution found it will display on the output
Fif solution not found the program that output that didn't have a solution

The program read a sudoku puzzle from a input file uses a recursive backtracking algorithm ot slove it
For each empty cell the program will try the number from 1 to 9 and check weather each number is valid if number is valid the program continues to the next empty cell
If no valid number the program will backtrack from the that branch and get the another number
When solution finds it will display and continue the new one
